

FSDL Final Mock Practical Problem Statements

UI + DOM + Interactivity

1. Develop a *Digital Glossary* that displays HTML formatting tags in a table and allows users to filter the content dynamically using a search bar.
 2. Design a reusable *Skill Bar Component* that accepts skill name and proficiency percentage as input and visually represents it.
 3. Create a *Pricing Toggle Interface* that switches between Monthly and Yearly subscription plans and updates prices dynamically.
 4. Develop a *Real-Time Profile Previewer* where user input in a form is instantly reflected in a profile card layout.
 5. Implement a *Theme Switcher* that allows users to toggle between Dark and Light modes, with preference stored using localStorage.
 6. Build a *Product Gallery* that dynamically displays products from a JSON dataset using cards and includes a “Buy Now” interaction.
 7. Design a *Responsive Navigation Bar* with at least one dropdown menu using HTML, CSS, and JavaScript.
 8. Create a *Photo Gallery* with at least six images and apply hover effects such as zoom or overlay.
 9. Implement a *Drag-and-Drop List* that allows users to reorder items dynamically.
 10. Develop an *FAQ Accordion* where clicking a question expands/collapses the answer section.
-

Logic-Based JavaScript Problems

11. Create a *Shopping Cart System* where users can increase/decrease product quantity and the total price updates automatically.
12. Develop a *Basic Calculator* that performs addition, subtraction, multiplication, and division operations.
13. Build a *To-Do List Application* that allows users to add and delete tasks dynamically.

14. Write a program that accepts a string input and performs operations such as reversing, converting to uppercase/lowercase, and calculating its length.
 15. Implement a *Stopwatch Application* with start, stop, and reset functionalities.
 16. Create a *Quiz Application* with multiple questions and display the final score after submission.
 17. Develop a *Product Filtering System* that filters items based on category selection.
 18. Build a *Notes Application* where users can add and delete notes, with data stored using localStorage.
-

HTML + CSS Design-Based

19. Design a *Structured Resume Webpage* including sections like Objective, Education, Skills, Projects, and Contact Information.
 20. Create a *Student Registration Form* with fields such as Name, Email, Gender, Course, and Address, and apply proper styling.
 21. Develop a *Weekly Timetable* using HTML tables with appropriate use of rowspan and colspan.
 22. Design a *Blog Layout* consisting of header, sidebar, content area, and footer using CSS layout techniques.
 23. Create a *Personal Portfolio Webpage* with sections: About, Skills, Projects, and Contact.
 24. Build an *Image Gallery with Category Filtering* using HTML, CSS, and JavaScript.
-

Data Visualization / Charts

25. Create a *Bar Chart* to visualize the number of students in different departments using static data.
26. Design a *Pie or Doughnut Chart* to represent attendance distribution (Present, Absent, Leave).
27. Develop a *Weather Dashboard* that displays weekly data using Line, Bar, and Pie charts.

28. Visualize *Student Performance Data* (marks, attendance, progress) using multiple chart types.

Backend / Database (Offline Local Setup)

29. Develop a *Student Record Management System* to store and retrieve student details (Name, Roll No, Branch) using MongoDB.

30. Create an *Event Registration System* that stores participant details (Name, Email, Event Name) in a database.
